**Abstract:** Based on testing of semi-coking wastewater quality, Fenton oxidation, distillation, stripping and anaerobic/aerobic treatment were used for treatment of semi-coking wastewater. The results showed that the semi-coking wastewater biodegradability could be greatly improved by Fenton oxidation method, and both ammonia and volatile phenol could be removed by distillation method, and only ammonia could be removed by blowing off method. After pre-treatment of semi-coking wastewater by Fenton oxidation method, COD and ammonia could be further removed by a combination of both anaerobic and aerobic biological methods. Eventually, a better technical scheme was put forward for treatment of semi-coking wastewater.

**Key words:** Semi-coking wastewater; physicochemical treatment; anaerobic and aerobic biological treatment; technical scheme

**Abstract:** Owing to underproduction and processes, the refrigerating equipment, by which the production processes are cooled, often stops. The production runs seriously bad. To solve this problem, a bypass is installed in the refrigerating system, and some cooling water is led to the chilled water system. Then, even if the production load changes greatly, the refrigerating equipment will not stop any more, and the production loss caused by the refrigerating stop has been avoided. According to thermodynamic theory, the issue about cooling water quantity, which is led from the cooling water system into the chilled water system, is analyzed. The led cooling water quantity at the minimum needed refrigerating load is obtained, and the maximum and minimum led cooling water quantities at different needed refrigerating loads are obtained too. Also, a certain led cooling water quantity, at which the refrigerating equipment will not stop any more on any needed refrigerating load, is determined. And the production running stability and security are ensured.

**Key words:** refrigerating system; optimization; cooling water; chilled water; security; stability
